

Record #043 and #044 Lever Cap

All Measurements were made with a plastic dial caliper, and are in millimetres.

The clamping action is a lever cap. In the right hand "usage" diagram it can be seen that the clamp pivots under a cast block on the plane body. When fabricating a new cap, the fit at this point should be checked.

The scalloped out sections on the cap perform multiple functions. The larger, face side one provides improved access when fitting and seating the blade. It also provides a place for the thumb to go, especially on the #043. The "toe" scallop is a chip deflector.
